

The diagram illustrates a liquid-cooled system. A central heat sink (13) is connected to a fan-cooled heat exchanger (5) via a liquid loop (11). The liquid loop consists of a pump (3) and various pipes (9, 9a, 11a, 11b, 147, 148). The heat exchanger (5) is mounted on a base (80) and features a fan (7) and a side panel (81). The system is designed to dissipate heat from the heat sink (13) through the liquid loop and the fan-cooled heat exchanger (5).
